modification by

mannosylphosphoryldolichol in

Golgi membranes of *Saccharomyces*

cerevisiae. In *Saccharomyces*

cerevisiae,

mannosylphosphoryldolichol

[M6-P/P-I] has been shown to be a

precursor of invertase (HexA).

Previous results showed that, in vivo,

mannosylphosphoryldolichol has the

following functions: (a) it is an intermediate in the conversion of phosphatidylinositol 4-phosphate into phosphatidylinositol mannoside and (b) it is a precursor of invertase by the addition of glucose. We report here that this glycosylated phospholipid is also a precursor of glycosylphosphatidylinositol [GPI] anchor in the Golgi membranes. Enzymatic labeling of M6-P/P-I using [3H]mannose, [3H]glucosamine, or [3H]galactose, and comparison with [14C]inositol labeling of GPI anchor showed that GPI is formed by the transfer of

M6-P from phosphatidylinositol to a hydroxyl group of mannose. Corticosterone production in response to physical exercise in elite female athletes. Corticosterone is a glucocorticoid steroid that plays a role in the regulation of homeostasis and resistance to stress. In this study, we investigated cortisol and corticosterone secretion in response to physical exercise in elite female athletes. Nine elite female athletes and nine non-athletes performed a simple physical activity consisting of a treadmill test lasting 2.5 h. Blood samples were collected

every 20 min during the first 2 h.
Cortisol levels did not differ between
athletes and non-athletes. Although
