This handy tool will do the calculations for you and give you the winch load rating you should be looking for. You can enter the weight of your vehicle, ground effect, and slope, along with the winch to ensure you get the right winch. Get a winch designed for your application. [Main menu](#) [Tag Archives: thoughts I was thinking about how I want to carry on this blog.](#) I have this tendency to keep going, when I think about having

these thoughts, they go through my head. I do want to do some more Blogs about experiences I have had in my life, how I have felt and the like. But I am unsure, if I would actually make it, because I have never done it. I mean it is easy to start a blog. But I don't know if it is even possible to continue a blog. I have been blogging about my thoughts, about my feelings and about my experiences. These are also

the things I want to do, but I am unsure, if I will actually ever make it. That is the reason why I don't really know, if I will be able to continue the blog. So I am going to ask myself the question, if I am still sure about continuing the blog. If the answer is yes, I would continue. If the answer is no, I won't continue. I want to share my thoughts, my experiences and also my feelings. That is why I started

this blog. Because I had a problem. With myself, that I was not able to share my thoughts, because I had no one to talk to. I was always afraid, that people would not understand me. But the thing is, if you don't speak out loud, how will people know, what you are thinking? If you think about it, you can make out, if you think something, but you will never say it. The only way is to speak out loud. So my goal is, that I share my

thoughts. For no one to hear, but me. I really want to continue the blog. Because I will be able to share my thoughts, about

A simple free to use 4x4 winch calculator and load estimator. Its possible to enter any vehicle size, ground effect percentage, and slope degrees. Will calculate the maximum winch load for the vehicles loaded weight and use the net winch load rating to see if that would work on your 4x4 trailer. You can also do 1 or 2 axle loads with separate

calculations and all the calculations are based on current winch load rating regulations. There are different calculations in the winch load tool and here they are:

Winch Hook Load =
Current winch rating x 2 x
(Weight x Ground Effect %)
/ 100

Winch Line Load =
Current winch rating x 4 x
(Weight x Ground Effect %)
/ 100

Winch Cable Load =
Current winch rating x 5 x
(Weight x Ground Effect %)

/ 100 Winch Pressure Load =
Current winch rating x 3 x
(Weight x Ground Effect %)

/ 100 Winch Pressure Line =
Current winch rating x 10 x
(Weight x Ground Effect %)

/ 100 Example calculations:

Maximum winch line and
cable load on vehicle: 16

tonne winch Vehicle weight:

6 tonne Total ground effect:

50% Total load: 10.2 tonne

Current winch rating is 6

tonne. Maximum winch line
and cable load = 6 tonne x 4

$x \ 10.2 / 100 = 78.8$ tonne

Maximum winch line and

cable load on vehicle = $16 \times$

$78.8 / 100 = 12.8$ tonne Net

winch line load on vehicle =

12.8 tonne For other

calculations and load settings

you will need to enter them

in the calculations tab. You

can also use this 4x4 winch

load calculator on an electric

or hydraulic winch scenario.

You enter your vehicles

Total Weight and Load

Weight, Ground Effect

Percentage and Slope
Degrees from a drop down
menu and it will make all the
calculations to see what 4x4
winch load rating would suit
you. One doesnt easily come
by a winch load calculator
and that is why Off The
Road Trading decided to
make this little application to
make it easier for everyone
out there looking to get an
electric or hydraulic winch.
Since most people dont know
what kind of rated winch

they should get it is a common question which often needs to be answered by a winch sales person, but no more is that needed with OTRs winch

What's New in the Off The Road Winch Load Calculator?

Off The Road Winch Load Calculator! This winch load calculator is a quick way to see what winch load rating you might need based on your vehicles weight and number of people. All you

need to do is enter your vehicles total weight and load weight, ground effect percentage and slope degrees in to get an approximate winch load rating. Off The Road Trading These days, when you are out exploring the off-road terrain, your truck has to provide the basic means to keep you and your equipment safe, secure and functional. They have to be able to deal with emergencies, when

necessary. The basic off-road equipment includes: safety, radios, fuel, sleeping equipment, food, and most importantly a winch for emergencies. There are many different winch models that are available, and you might be wondering which one would work best for your use. Not sure if a winch would be the right tool for you? Well, we have designed this off-road winch load calculator so you can find out

how much winch load you will need before you actually go to the off-road equipment store. It allows you to enter your vehicle total weight and load weight, ground effect percentage and slope degrees to determine your winch load rating. The load rating includes a certain winch load level. You will know what winch you need to buy. That's pretty much it. This will give you an idea about what you need, based on the

way you intend to use it. How is it designed? This off-road winch load calculator does not need any personal information. It is a one-page user-friendly application. The calculator itself is a simple and easy-to-use tool. All you have to do is fill in your vehicle weight and weight, and ground effect and slope degrees. When you enter a few of those, it will generate an approximate winch load rating, which will

allow you to determine the winch that will best fit your needs. For example, if you have a vehicle with a total weight of 2000 lbs, and a weight of 1000 lbs, ground effect of 80%, slope of 35 degrees and it is a 2000 lb load, the winch load rating would be: $2000 - 1000$ The winch load rating will be: $2000 - 1000 = 1000$ $2000 \times 4 = 8,000$ lbs $2000 / 8,000 = 0.25$ It would therefore be an 8,000 lb winch. If you have a

vehicle with a weight of
2000 lbs and load of 1000 lbs
and ground effect of 80%,
slope of 35 degrees, then the
winch load rating would be:
 $2000 - 1000 = 1000$
 $1000 \times 4 = 8,000$

System Requirements For Off The Road Winch Load Calculator:

**Minimum: OS: Windows
7/Windows 8/Windows 10
CPU: Intel Core 2 Duo
E4500 @ 2.8 GHz/AMD
Phenom X4 945 @ 2.8 GHz
RAM: 4 GB (Windows
32-bit) 8 GB (Windows
64-bit) HD: 1 GB Graphics:
NVIDIA 8600GT/AMD HD
3650/ATI HD 4570 (32-bit)
DirectX: Version 9.0c Hard
Drive: 300 MB Additional
